

BlueprintDNA

Requirements that are precise enough to build from

BlueprintDNA compiles, categorizes and confirms detailed requirements and process flow into a deliverable blueprint: value streams break into process areas, processes, user stories and acceptance criteria, with tasks at every level. Seeded from a methodology catalog or from AI, refined in workshops, and owned by the engagement.

WHAT IT DOES

- End-to-end through acceptance criteria in one navigable tree
- Seeded from a catalog master so you start with structure instead of a blank page
- Workshop mode for refining with the client in the room
- Fit/gap tracking against the target system
- Pushes to Azure DevOps and keeps the link both ways
- The blueprint is vendor-neutral — it can feed any integrator's program

Who it is for. Business analysts, solution architects and delivery leads.
