

# BuilderDNA

## Turn the blueprint into working software

BuilderDNA takes the blueprint, the documents that describe your software in detail, and the change you have asked for, and performs the build into a Dev or Sandbox environment for testing and regression audit. Sprints run agents that audit usability, interface consistency and user flow, write QA tickets, and then act on them.

### WHAT IT DOES

- Sprints that write their own QA tickets and then address them
- Self-correcting code with a summary and counts at sprint close
- Builds into Dev or Sandbox — never straight at production
- Promotion path Dev to Sandbox to Production, with backup and one-button rollback
- Regression audit before anything is promoted
- You test and approve; nothing ships on the machine's say-so

**Who it is for.** Teams who want their requirements to build the software, not just describe it.
